

# Genetic markers for LAB beer-spoilage and the role of dissolved CO<sub>2</sub>/pressure on bacterial growth in beer.

Jordyn Bergsveinson\* and Barry Ziola

June 15<sup>th</sup>, 2015

ASBC Annual Meeting, La Quinta CA

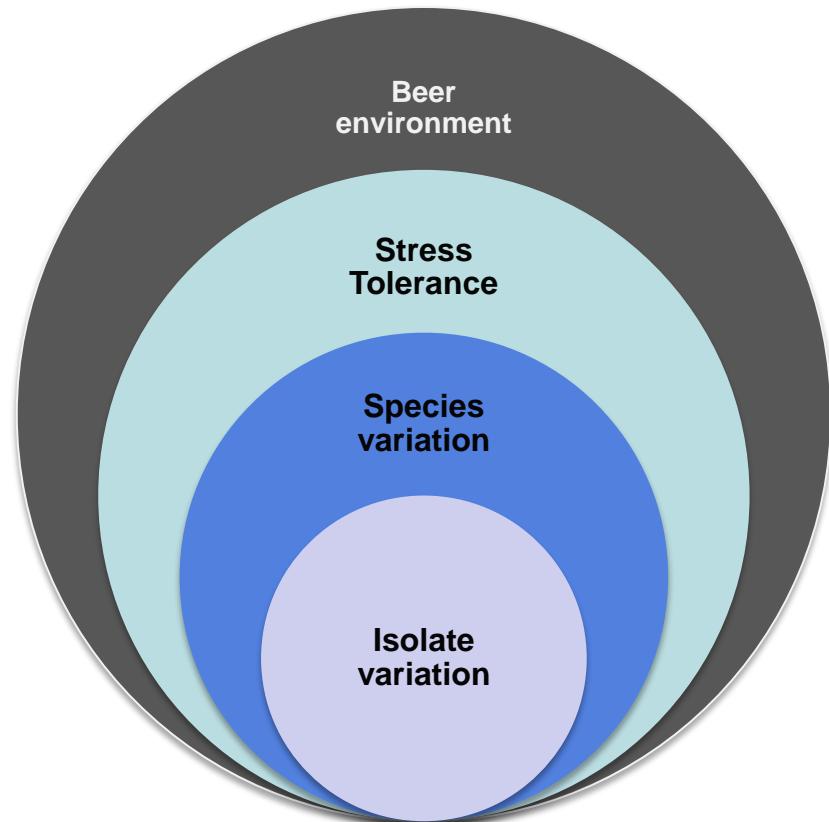

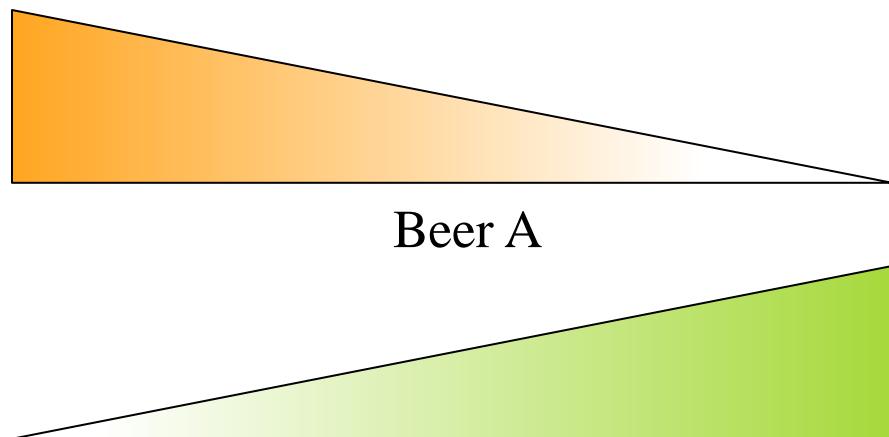

(1) Pittet, V. (2012). *Adaptation of lactic acid bacteria for growth in beer*. Unpublished doctoral dissertation, University of Saskatchewan, Saskatoon, Saskatchewan

# We stress “stress” – what about dCO<sub>2</sub>?

Beer Stress	Relevance for LAB
Hops	Defining – relative scale of tolerance
Low O <sub>2</sub>	LAB ~ anaerobic
Low pH, ethanol (%)	LAB intrinsically tolerant
Low Nutrient Availability	General starvation
Pressure/dCO <sub>2</sub>	?? – Process vs. Product contamination

# Beer-Spoilage ≠ Binary Phenotype

# Hop-tolerance ≠ “the Holy Grail

- *hitA, horA, horB, horC, bsrA*
  - not universal – false (+) and false (-)
  - detection does not guarantee function
  - plasmid-harbored...assumed conservation
- **3-4 genes to describe all of LAB BSOs!?**
  - Need to expand search → dCO<sub>2</sub>!

# Effect of standard pressure/dCO<sub>2</sub>

- 20 LAB isolates assayed +/- growth in +/- dCO<sub>2</sub> b
  - 10 isolates no growth
  - 5 isolates static
  - 5 isolates grow = True BSOs
- No genus/species correlation
- No correlation with hop and ethanol-tolerance
- **Highlights difference between process contamination vs. product contamination**

# Power of “omics”:

LAB and brewery  
diversity

Genetic:

- genomic seq.
- metagenome

Transcriptional:

- transcriptome seq.
- metatranscriptome

Non-BSOs

Universal Genetic  
Markers

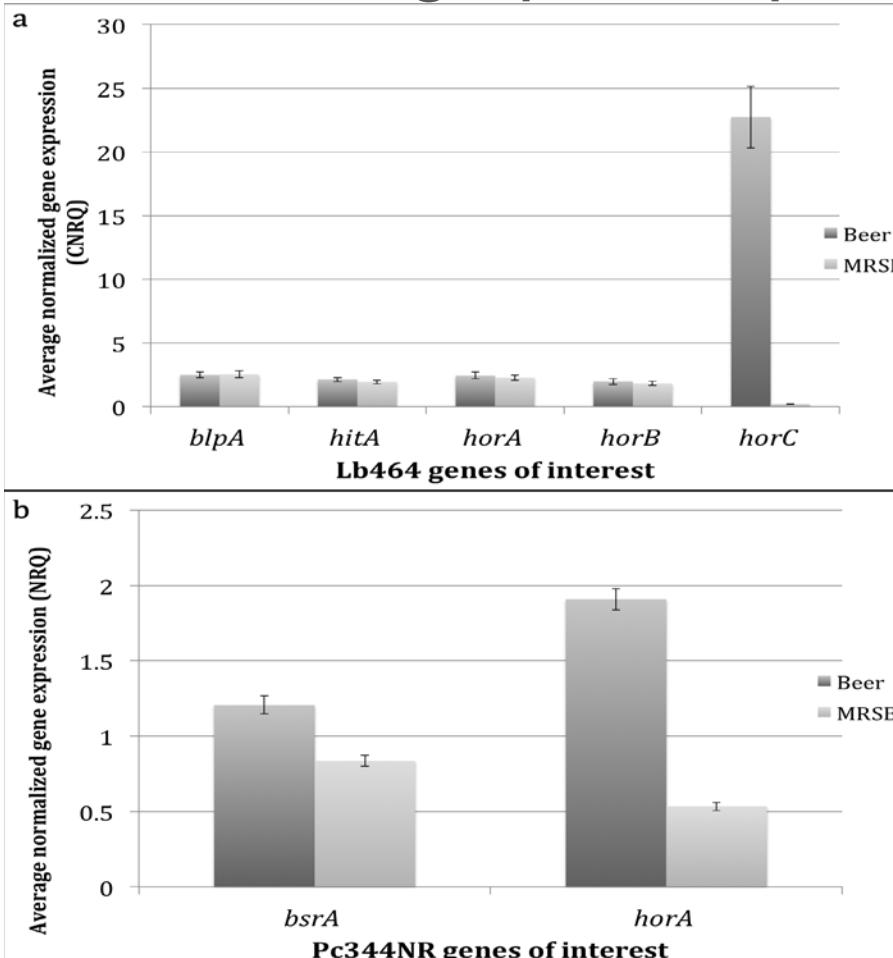

Commonalities?  
Differences?

BSOs

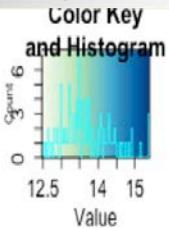

Beer

Microflora

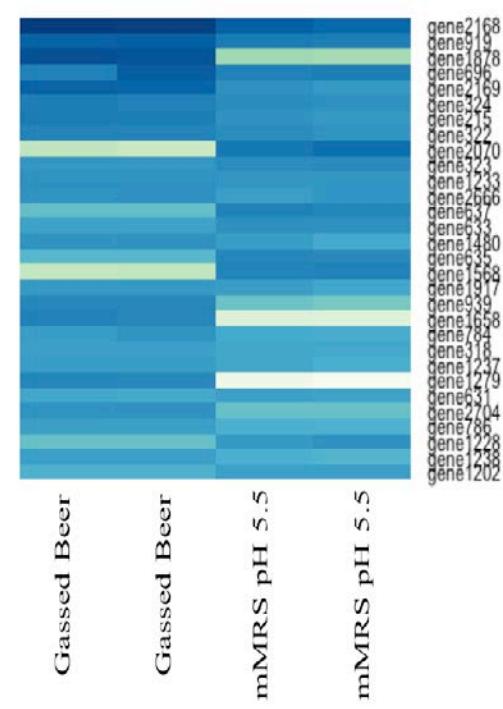

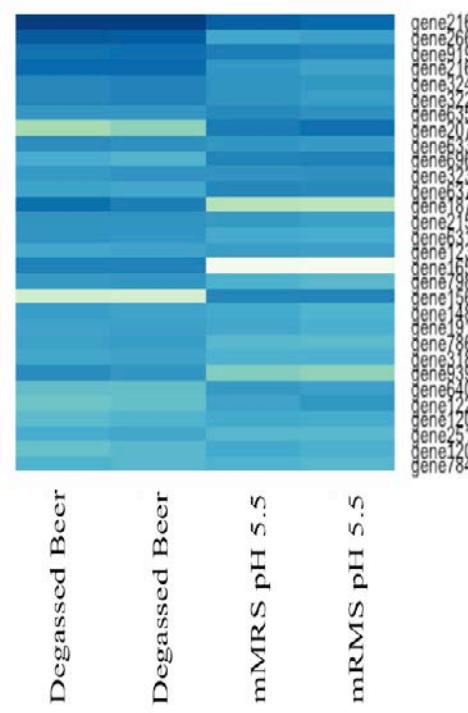

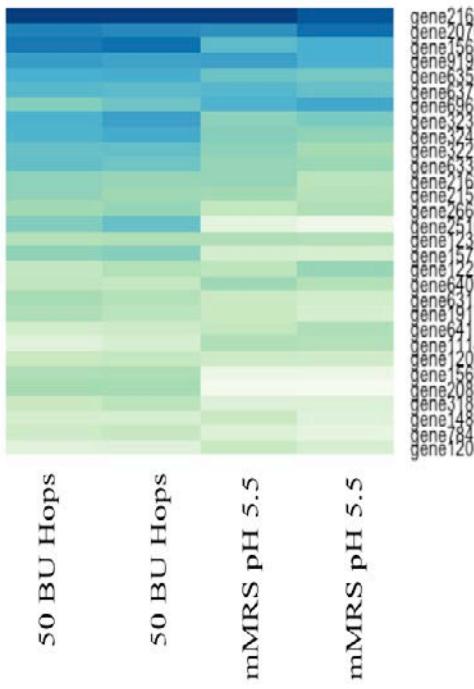

# Teasing apart hops, beer, (and dCO<sub>2</sub>)

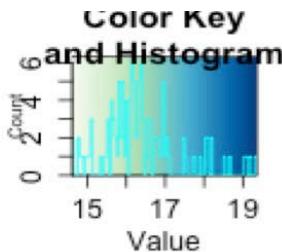

Lb464	Pc344
~135 BU hops	~54 BU hops
48 h in degassed beer	72 h in degassed beer
Growth in gassed beer	No growth in gassed beer
8 plasmids	8 plasmids
2.5 MB	1.8 MB
2,425 CDS	1,740 CDS
(184 ~plasmids)	(129 ~ plasmids)

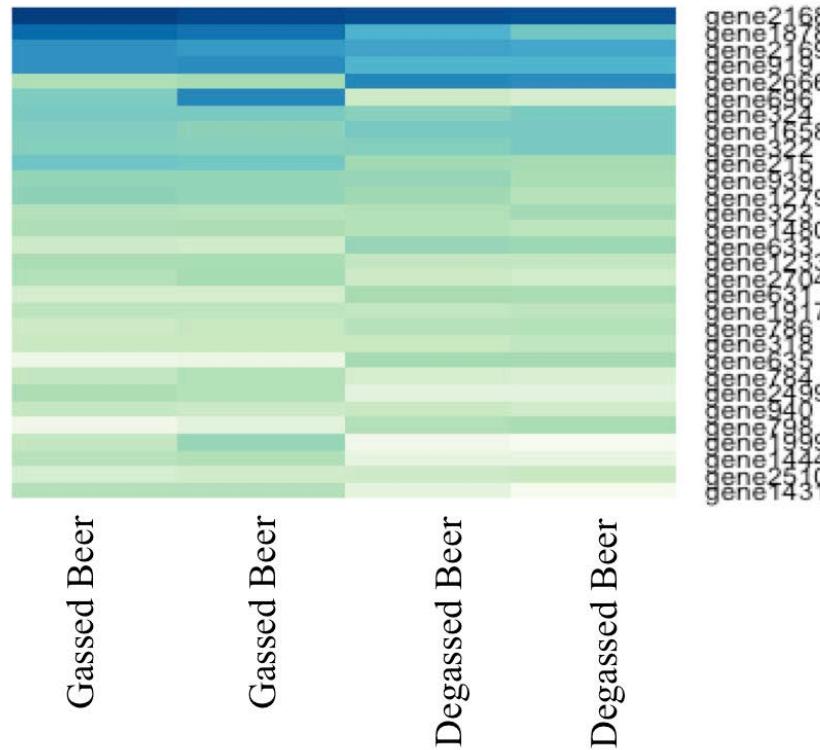

## Patterns of Lb464 gene expression across conditions

## dCO<sub>2</sub> affect on Lb464?

“What’s important?”

DNA repair, energy  
maintenance, cellular export,  
peptidase M23B

hypothetical proteins!!

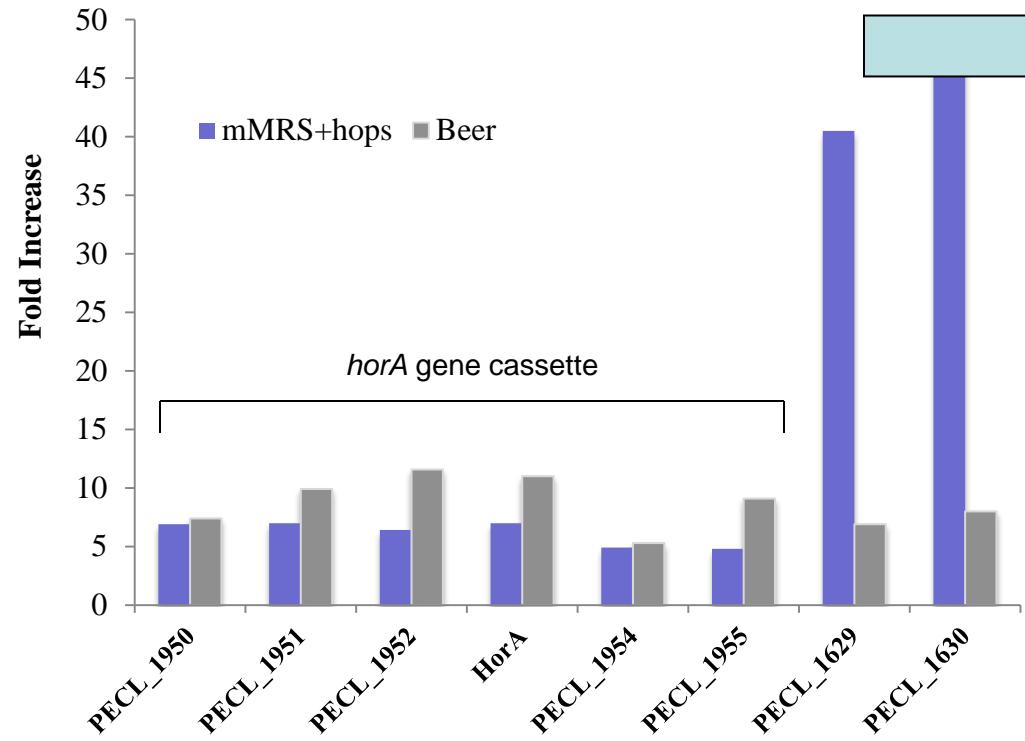

“What’s distinct?”

**Gene 1792** – Na<sup>+</sup>/H<sup>+</sup> anitporter

**Gene 1580** – “membrane”  
protein – brewing *L. brevis*

**Gene 1428** – “membrane”  
protein – brewing *Lactobacillus*

# Hops vs. Beer Pc344:

Locus_tag	Fold	Gene;	Location	Fold
	Increase 30	Description		Increase
	BU hops			in Beer <sup>a</sup>
PECL_1630				7.8
PECL_2059	42.8	putative ncRNA	chromosome	32*
PECL_1629	40.5	TetR family transcriptional regulator	chromosome	2.9
PECL_2042	22.4	hypothetical protein	pPECL-8	7.8
PECL_1743	21.9	VIT family protein	chromosome	NDE <sup>b</sup>
PECL_1544	18.7	AAA ATPase	chromosome	15.5
PECL_1708	17.3	putrescine carbamoyltransferase	chromosome	90*
PECL_1605	16.5	prolyl oligopeptidase family protein	chromosome	25*
PECL_1744	14.8	hypothetical protein	chromosome	NDE
PECL_1591	13.9	monooxygenase	chromosome	2.1
PECL_1707	13.4	aguD, agmatine/putrescine transporter	chromosome	269*

## Brewing-related plasmids:

- Toxin/antitoxin systems
- bacteriophage – BSO tolerance vs. susceptibility
- Metal ion transport and efflux pumps
- Carbohydrate fermentation patterns

**TRACKING DISTRIBUTION IN BREWERY??**

# Omics → Specifics

- dCO<sub>2</sub> a selective pressure for BSOs
- Tentative species-specific responses
  - conserved responses in species
  - isolate-specific?
- Membrane modification & unique energy producing pathways appear key
- BSO plasmids harbor other non-hop tolerance genes of interest
