

Starting a research program

Luke Chadwick

Senior Scientist, Bell's Brewery Inc.

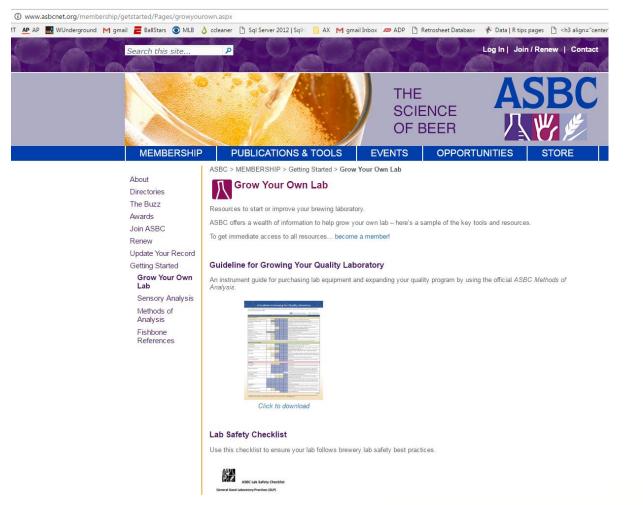

Inspired Brewing*

Research: the generation of new knowledge relating to better control of beer quality.

Lab equipment ⊆ Analytical tools

The most important research tools relate to the high-level structure and purpose of the work. For guidance on laboratory equipment purchases, start with the ASBC 'grow your own lab' documentation

Why do research and what can it help do for the process or quality?

- Save money
- Save time
- Save materials
- Increase knowledge
- Improve workflow
- Understand new flavors
- Make more consistent beers

Basic steps

Following these steps will lead you to all the tools you need

- 1. Define the problem
- 2. Literature review
- 3. Define the endpoints and establish a way to measure them
- 4. Factor exploration
- 5. Design of Experiments
- 6. Carry out experiments
- 7. Process and Review the data
- 8. Curate the data

1. Define the Problem

A well-defined problem often contains its own solution within it, and that solution is usually quite obvious and straightforward. By defining problems properly, you make them easier to solve, which means saving time, money and resources.

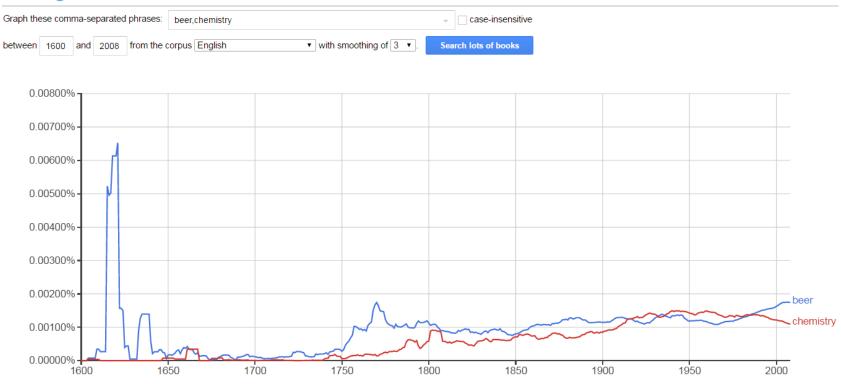

-Michael Cooper Defining Problems: The Most Important Business Skill You've Never Been Taught https://www.entrepreneur.com/article/237668 Sep 26, 2014

2. Literature review

• Don't rush to measure until you have solid foundation of the relevant literature.

Google Books Ngram Viewer

"A month in the laboratory can often save an hour in the library." - Frank Westheimer

2017 ASBC Meeting •

3. Define endpoints and measurement system

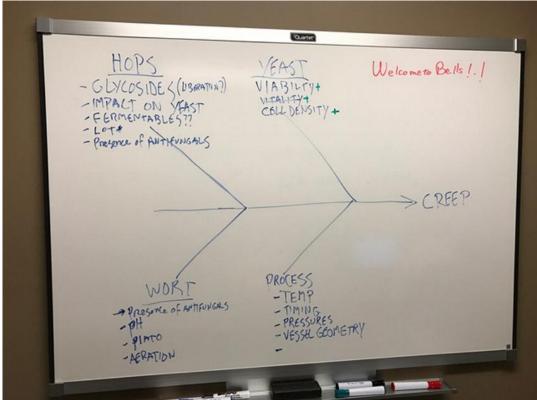

- Sensory? Analytical? Micro?
- Keep it numerical
- Establish measurement error
 - Carefully chosen standards and control samples
 - Match the matrix!
 - Gage Repeatability and Reproducibility (GageR&R)

4. Factor exploration

• With the biggest team of stakeholders you can pull together, make a list of all potential variables that could impact the endpoint in question (positively or

negatively)

2017 ASBC Meeting

5. "Design of Experiments" Factors → endpoints

- Decide which factors to..
 - Vary as part of the experiment
 - Hold constant
 - [only] document
- Establish in advance:
 - Home for the data
 - criteria for action/success
 - (Reaction plans)

2017 ASBC Meeting

6. Carry out experiments

- Incorporate replicates and 'knowns'
- Safety always!
- Review all possible hazards
- Safety Data Sheets (SDS) onsite
- Proper PPE
- No tasting anything that isn't food-grade!
 - Dedicated collection vessels and glassware for sensory work!

7. Process and Review the data

Pivot tables, conditional formatting and heatmaps are awesome

 $CV = \underline{C}$ oefficient of \underline{V} ariation = RSD = \underline{r} elative \underline{s} tandard \underline{d} eviation = $\frac{\text{standard deviation}}{\text{average}} \times 100\%$

7b. Process and Review the data

[in advance]: Think through the relationship between data entry and data summaries 2017 ASBC Meeting

8. Curate the data

- It doesn't end with the creation of a table or a graph
- Research results must be...
 - Translated

To <u>non</u>-scientists

- Communicated
- Documented

A codified approach to research will lead you either to the next set of experiments, the next research project, or the satisfaction that the problem is solved!

Well-curated data from well-designed experiments will be useful to posterity. Even if the results are 'negative'.

Note: curate \approx summarize+archive \neq censor or massage

Random

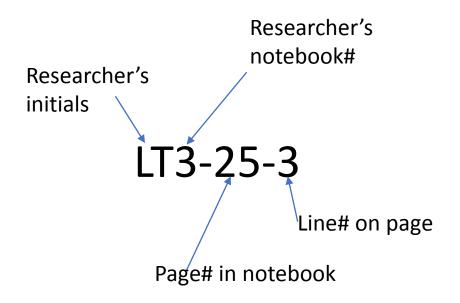

- Beware the 'fishing expedition'
- Randomize experiments and samples
- Standardize your sample coding system
- Make runsheets
 - Before starting the experiment: think through the detailed workflow and every variable that may arise along the way

Example: Dr. Norman R. Farnsworth's sample coding system

GRAND GED MAN OF FHARMACOGNOS

If we need more info about this sample, we go to the notebook LT3, flip to page25, and down to line#3 and the info we need.

Summary

- Don't use research to find problems
- DO use research to attack them!
